The purpose of this chapter is to give a perspective of patient safety culture by users of public health units through a qualitative analysis of open questions asked. The sample consists of 241 patients from the health region of Algarve. The open questions were the object of content analysis in thematic and categorical form, followed by lexical treatment using the Iramuteq software. From the patients’ point of view, the evolution of patient safety is the result of an understanding of the meaning of the highlighted terms (safety, health, meaning), as well as of the intervention and improvement in these categories. It is known with these associations that for the patient, patient safety involves the existence of professionals for each individual (personal) and the existence of a receptive and empathic nature on the part of the professionals (human), as well as the need to demystify care for the understanding of patients (technician/knowledge) and the provision of care completely focused on the patient (attention).
INTRODUCTION

The provision of healthcare is liable to include events with serious consequences for patients, professionals, institutions, and society in general. These are reflected in the quality of life of patients, loss of confidence in healthcare organizations and professionals, dissatisfaction and demoralization of the professionals involved, the increase of social and economic costs, cases of dispute and in reducing the possibility of reaching the expected results (NPSA, 2004). The concern with the issue of Patient Safety (PS) by various governments of different latitudes and international organizations is growing due to the high number of incidents reported by citizens, without the equivalent notice by the health professionals involved.

The negative impact resulting from healthcare incidents is a reality for the affected patient, but it must be seen as a problem to be solved by all the actors involved. The need for a paradigm shift in the health professional-patient relationship has been reinforced by the increase in the available information that the patient has about his health condition (Busch, Saxena, & Wu, 2020). In the past, he placed all confidence in health professionals without judging the consequences of his intervention in the provision of healthcare. From the moment that the patient accesses the information not only about the disease but, and above all about the possibilities of available treatments and the respective results expected from them, his ability to “confront” professionals about possible incidents resulting from the provision of care is much higher than what happened in the past, which is not always welcomed on the part of professionals (Etchegaray, Ottosen, Dancsak, & Thomas, 2017).

This should not be the major reason that moves us to contribute to a paradigm shift concerning patient safety, but rather the overriding interest in the preservation of human life, thus guaranteeing the fundamental principles that the constitutions of civilized countries safeguard regardless of economic issues. The costs associated with healthcare incidents cannot be neglected not only for the patient but for the entire health care system. The use of Accreditation Systems by health institutions is a current and growing practice, however, it is necessary to carry out processes involving all stakeholders (patients, health professionals, the community, and politicians).

The patient as the central figure must play an active role, by facilitating communication channels in health care institutions with professionals at different levels of the organization. The complementary role of this information with the one provided by health professionals would enable the establishment of an ecologically balanced patient safety system.

In the quality of health care, patient safety has been highlighted in recent years, due to the need for patients and family members to feel safe and confident about health care, as well as professionals who want to provide safe, effective, and efficient care (Fragata, 2011). The WHO also recommends that the change in behaviours and attitudes comes from the culture of security established within the organization. This is the result of individual and group values, attitudes, perceptions, skills and behavioural patterns that determine the commitment to safety. To identify areas for improvement and introduce changes in the behaviour of professionals, it is necessary to assess and monitor the organization’s safety culture for continuous improvement (WHO, 2009).

Although in recent decades, health policy in Portugal has evolved significantly, it requires an assessment of the effectiveness and status of the implementation of its strategies. The small number of studies in this area in Portugal and especially in the Algarve Region (RAlg) associated with an integrated and global perspective of safety, was the determining assumption for carrying out this work. The subject of patient safety, which is currently relevant, is an unavoidable and priority issue in the management of
Patient Safety: The Patient's Perspective From Public Sector Health Institutions in the Algarve Region, Portugal

Abstract
The purpose of this chapter is to give a perspective of patient safety culture by users of public health units through a qualitative analysis of open questions asked. The sample consists of 241 patients from the health region of Algarve. The open questions were the object of content analysis in thematic and categorical form, followed by lexical treatment using the Tramuteq software. From the patients' point of view, the evolution of patient safety is the result of an understanding of the meaning of the highlighted terms (safety, health, meaning), as well as of the intervention and improvement in these categories. It is known with these associations that for the patient, patient safety involves the existence of professionals for each individual (personal) and the existence of a receptive and empathic nature on the part of the professionals (human), as well as the need to demystify care for the understanding of patients (technician/knowledge) and the provision of care completely focused on the patient (attention).
The provision of healthcare is liable to include events with serious consequences for patients, professionals, institutions, and society in general. These are reflected in the quality of life of patients, loss of confidence in healthcare organizations and professionals, dissatisfaction and demoralization of the professionals involved, the increase of social and economic costs, cases of dispute and in reducing the possibility of reaching the expected results (NPSA, 2004). The concern with the issue of Patient Safety (PS) by various governments of different latitudes and international organizations is growing due to the high number of incidents reported by citizens, without the equivalent notice by the health professionals involved.

The negative impact resulting from healthcare incidents is a reality for the affected patient, but it must be seen as a problem to be solved by all the actors involved. The need for a paradigm shift in the health professional-patient relationship has been reinforced by the increase in the available information that the patient has about his health condition (Busch, Saxena, & Wu, 2020). In the past, he placed all confidence in health professionals without judging the consequences of his intervention in the provision of healthcare. From the moment that the patient accesses the information not only about the disease but, and above all about the possibilities of available treatments and the respective results expected from them, his ability to “confront” professionals about possible incidents resulting from the provision of care is much higher than what happened in the past, which is not always welcomed on the part of professionals (Etchegaray, Ottosen, Dancsak, & Thomas, 2017).

This should not be the major reason that moves us to contribute to a paradigm shift concerning patient safety, but rather the overriding interest in the preservation of human life, thus guaranteeing the fundamental principles that the constitutions of civilized countries safeguard regardless of economic issues. The costs associated with healthcare incidents cannot be neglected not only for the patient but for the entire health care system. The use of Accreditation Systems by health institutions is a current and growing practice, however, it is necessary to carry out processes involving all stakeholders (patients, health professionals, the community, and politicians).

The patient as the central figure must play an active role, by facilitating communication channels in health care institutions with professionals at different levels of the organization. The complementary role of this information with the one provided by health professionals would enable the establishment of an ecologically balanced patient safety system.

In the quality of health care, patient safety has been highlighted in recent years, due to the need for patients and family members to feel safe and confident about health care, as well as professionals who want to provide safe, effective, and efficient care (Fragata, 2011). The WHO also recommends that the change in behaviours and attitudes comes from the culture of security established within the organization. This is the result of individual and group values, attitudes, perceptions, skills and behavioural patterns that determine the commitment to safety. To identify areas for improvement and introduce changes in the behaviour of professionals, it is necessary to assess and monitor the organization's safety culture for continuous improvement (WHO, 2009).

Although in recent decades, health policy in Portugal has evolved significantly, it requires an assessment of the effectiveness and status of the implementation of its strategies. The small number of studies in this area in Portugal and especially in the Algarve Region (RAlg) associated with an integrated and global perspective of safety, was the determining assumption for carrying out this work. The subject of patient safety, which is currently relevant, is an unavoidable and priority issue in the management of health organizations and the provision of healthcare. That said, this chapter intends to give a perspective on the culture of patient safety by users of the RAlg public health units through a qualitative analysis regarding open questions asked to users/patients.
# Table of Contents

**Preface**.................................................................................................................................................. xv

**Chapter 1**
Twin Contributors to the Physiology of Ambulatory Wellbeing and Falls Prevention in Ageing Populations: Functional Senescence and Abnormal Pathological Change......................................................... 1
  *Catherine Hayes, University of Sunderland, UK*

**Chapter 2**
Integrating Social and Health Services for People, Communities, Homes, and Places......................... 21
  *Maddalena Illario, University of Naples Federico II, Italy*
  *Vincenzo De Luca, University of Naples Federico II, Italy*
  *Regina Roller-Wirnsberger, Medical University of Graz, Austria*

**Chapter 3**
Fall-Risk-Increasing Drugs: Background, Current Evidence on Deprescribing, and Future Perspectives.................................................................................................................... 67
  *Lotta Seppala, University of Amsterdam, The Netherlands*
  *Nathalie van der Velde, University of Amsterdam, The Netherlands*

**Chapter 4**
Bone Density and Fall Risk Screening in Algarve: A Preliminary Study ................................................ 77
  *Luis Pedro Vieira Ribeiro, Health School, University of Algarve, Portugal*
  *Pinheiro Joã, Health School, University of Algarve, Portugal*
  *António Fernando C. L. Abrantes, Health School, University of Algarve, Portugal*
  *Anabela de Magalhães Ribeiro, Health School, University of Algarve, Portugal*
  *Bianca I. C. Vicente, Health School, University of Algarve, Portugal*
  *Rui Pedro Pereira de Almeida, Health School, University of Algarve, Portugal*
  *Tânia Gonçalves, Health School, University of Algarve, Portugal*
  *Maria Augusta Ferreira, School of Health Sciences, University of Algarve, Portugal*
  *Maria Conceição Farinha, Health School, University of Algarve, Portugal*
  *Kevin Barros Azevedo, Health School, University of Algarve, Portugal*

**Chapter 5**
Effects of Spaceflight, Aging, and Bedrest on Falls: Aging Meets Spaceflight! ....................................... 91
  *Nandu Goswami, Medical University of Graz, Austria*
Chapter 6
The Role of Neuroimaging in Fall Prevention in Healthy Adults at Risk of Alzheimer’s Disease .... 107
Albert Dayor Piersson, Department of Imaging Technology and Sonography, University of Cape Coast, Cape Coast, Ghana
Wiam Elshami, College of Health Sciences, Medical Diagnostic Imaging, University of Sharjah, UAE
Alberta Naa Afia Adjei, Department of Medical Diagnostics, College of Health Sciences, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana
Klenam Dzefi-Tettey, Department of Radiology, Korle bu Teaching Hospital, Accra, Ghana
Philip N. Gorleku, Department of Imaging Technology and Sonography, University of Cape Coast, Cape Coast, Ghana

Chapter 7
Fall Risk and the Use of Exercise as a Fall Prevention Strategy .......................................................... 130
Rafael Nogueira Rodrigues, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal
Eduardo Carballeira, Faculty of Health Sciences, University of A Coruña, Spain
Fernanda M. Silva, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal
Adriana Caldo, Independent Researcher, Portugal
Fabio Ceschini, São Judas Tadeu University, Brazil
Manuel A. Giráldez-García, Faculty of Physical Activity and Sport Science, University of A Coruña, Spain
Cidalina da Conceição Ferreira de Abreu, Nursing School of Coimbra, Portugal
Guilherme Eustaquio Furtado, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal
Ana Maria Teixeira, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal

Chapter 8
Fall Prevention in Education and Training of Healthcare Students, Professionals, and Non-Professionals ................................................................. 157
Marja Anneli Äijö, Savonia University of Applied Sciences, Finland
Satu Havulinna, National Institute for Health and Welfare, Finland
Saija Karinkanta, The Social Insurance Institution of Finland, Finland & Research at Kela, Finland & The UKK Institute for Health Promotion, Finland
Tarja Tervo-Heikkinen, Kuopio University Hospital, Finland
Eija Lönnroos, University of Eastern Finland, Finland

Chapter 9
Fall Prevention Education: Good Examples From Higher Education .................................................. 171
Marja Äijö, Savonia University of Applied Sciences, Finland
Cidalina da Conceição Ferreira de Abreu, Nursing School of Coimbra, Portugal
Nandu Goswami, Medical University of Graz, Austria
Chapter 10
Health and Fall Risk Monitoring Within Common Assessments
Rafael Nogueira Rodrigues, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal
Adriana Caldo, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal
Fernanda M. Silva, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal
Cidalina Conceição Ferreira Abreu, Nursing School of Coimbra, Portugal
Guilherme Eustaquio Furtado, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal
Ana Maria Teixeira, Faculty of Sport Sciences and Physical Education, University of Coimbra, Portugal

Chapter 11
Patient Safety: The Patient’s Perspective From Public Sector Health Institutions in the Algarve Region, Portugal
Anabela de Magalhães Ribeiro, Health School, University of Algarve, Portugal
Luis Pedro Ribeiro, Health School, University of Algarve, Portugal & CIDAF, FCDEF, Universidade de Coimbra, Portugal
Carlos Alberto Silva, School of Health and Human Development, University of Évora, Portugal
Luís Pedro Magalhães-Ribeiro, Faculty of Medicine, University of Coimbra, Portugal

Chapter 12
Fall Prevention Activities and Resources in Norway: A Review
Ankica Babic, University of Bergen, Norway

Chapter 13
Falls and Fall Injuries as Societal Challenges in Namibia
Nestor Tomas, University of Namibia, Namibia
Daniel Opotamutale Ashipala, University of Namibia, Namibia
Theolinda Nuugwanga Tomas, Hangana Seafood Clinic, Walvis Bay, Namibia

Chapter 14
Integrated Care in Prevention: Maturity and Upscaling
Patrik Eklund, Umea University, Sweden

Chapter 15
Information and Process in Health
Patrik Eklund, Umea University, Sweden
